Program No.1

Demonstration of different HTML tags

Aim :- To create a simple HTML file to demonstrate the use of different tags

Algorithm :-

Step 1- Open a text editor or HTML editor.

Step 2- Start with an HTML5 doctype declaration: .

Step 3- Add the opening and closing html tags.

Step 4- Add the head section within the html tags.

Step 5- Within the head section, add a title tag to give the page a title.

Step 6- Add a link tag within the head section to link to a stylesheet if needed.

Step 7- Add the body section within the html tags.

Step 8- Add a header section within the body tags to include any header information you want.

Step 9- Add a nav section within the body tags to create a navigation menu for the links.

Step 10- Within the nav section, create a list of links using the ul and li tags.

Step 11- Use the a tag within each li tag to link to the appropriate HTML pages.

Step 12- Add a section tag within the body tags to contain the main content of the page. 14. Within the section tag, create any additional div or article tags needed to organize the content.

Step 13- Add an img tag within the section tag to include any images needed.

Step 14- Use the table tag to create any tables needed within the section tag.

Step 15- Within the section tag, use the a tag to create links within the same page using href="#anchor" and id="anchor" to specify the location of the link.

Step 16- Add a footer section within the body tags to include any footer information you want.

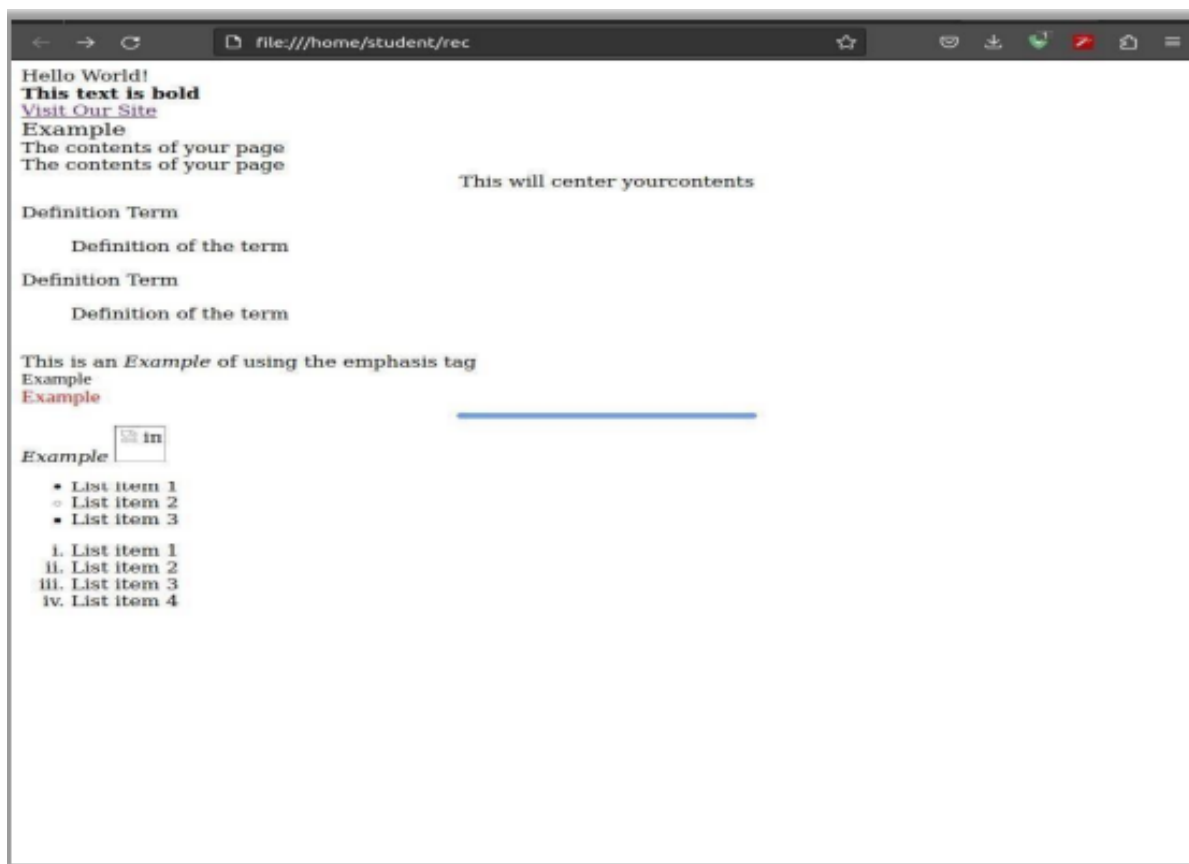

Step 17- Close the body section and the html section.

```

<li type="circle">List item 2</li>
<li type="square">List item 3</li>
</menu>
<ol type="i">
<li>List item 1</li>
<li>List item 2</li>
<li>List item 3</li>
<li>List item 4</li>
</ol>
</body>
</html>

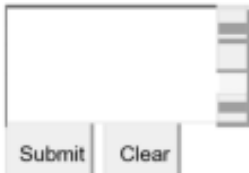

```

Output:

Program No.2

Link different HTML pages

Aim: Create a HTML file to link to different HTML page which contains images, tables, and also link within a page.

Algorithm:-

Step 1: Start

Step 2: Open the html and head tags and set the page title to "biodata".

Step 3: Start the body tag to define the content of the webpage.

Step 4: Create a center tag to center the title text and display the title "BIODATA" in a <h1> tag and make it bold using .

Step 5: Display the biodata details in unordered list (ul) with circle-type bullet points (type="circle"). Add several list items (li), each containing specific biodata information Name, Age, Gender, Father's name, Mother's name.

Step 6: Use the <a> tag to create a hyperlink that directs to Education.html with the text "My educational qualification".

Step 7: End the biodata.html file by closing the body and html tags.

Step 8: Create new html file qualification.html .

Step 9: Open the html and head tags and set the page title to "qualification".

Step 10: Start the body tag to define the content of the webpage.

Step 11: Create a center tag to center the text and display the header "Educational Qualification" in an <h1> tag.

Step 12: Use a <table> tag to define a table with the following attributes: border of 4, cellpadding of 2, cellspacing of 2, and width of 75%.

Step 13: Create a row (<tr>) for the table header and add column headers using the <th> tag "Qualification and Institute" (spans 3 columns), "Mark" (spans 2 columns).

Step 14: Add rows for different educational qualifications.

Step 15: Use the <a> tag to create a hyperlink that directs to Profile.html with the text "My profile photo".

Step 16: End the Education.html file by closing the center, body, and html tags.

Step 17: Create new html file qualification.html .

Step 18: Open the html and head tags and set the page title to "Photo".

Step 19: In the body of the page, create a center tag to center the image.

Step 20: Use the tag to display the profile photo. Set the src attribute to "11.png" (the image file).

<th colspan="2">Mark</th>

        </center>
    </body>
</html>

```

Output:-

A screenshot of a web browser window. The address bar shows the file path: file:///C:/Users/jeromy/subprgm2.html. The page title is "Educational Qualification". Below the title is a table with columns for Education, Year of Pass, Institute, Total mark, and Percentage. The table lists qualifications from SSLC to AI Course. A link "My profile photo" is visible below the table. The Windows taskbar is visible at the bottom with various application icons and a system clock showing 11:59 on 09-01-2025.

Qualification And Institute			Mark	
Education	Year of Pass	Institute	Total mark	Percentage
SSLC	2019	Govt.HS Alappuzha	500	89%
Plus Two	2021		1107	92%
Graduation	2024	SD College Alappuzha	600	75%
ML Course	2024	InfoTech Ernakulam	100	70%
AI Course	2024	Qspiders Palarivattom	60	71%

                                <frame src="frame.html">

                                    </frameset>

                            </frameset>

                        </frameset>

                    </frameset>

                </frameset>

            </frameset>

        </head>

        <body>

        </body>

</html>
```

Program No.3

HTML pages with different frames

Aim :- To create a HTML page with different types of frames such as floating frame,navigation frame & mixed frame.

Algorithm :-

Step 1. Open a text editor or HTML editor.

Step 2. Add the frameset section within the html tags.

Step 3. Within the frameset section, specify the number and size of the frames using the frame and frameset tags.

Step 4. Use the frame tag to define each frame and its contents.

Step 5. Use the src attribute within the frame tag to specify the URL of the content to be displayed in the frame.

Step 6. Use the name attribute within the frame tag to specify a name for each frame.

Step 7. Use the cols or rows attribute within the frameset tag to specify the layout of the frames either horizontally or vertically.

Step 8. Use the frameborder attribute within the frameset tag to specify whether or not the frames should have borders.

Step 9. Use the border attribute within the frame tag to specify whether or not the frame contents should have a border.

Step 10. Use the scrolling attribute within the frame tag to specify whether or not the frame content should have scrollbars.

Step 11. Add a noframes section within the frameset section to display content for browsers that do not support frames.

Step 12. Within the noframes section, add HTML code to display content for browsers that do not support frames.

First.html

```
<html>

  <head>

    <title></title>

    <style>

      h1{

        font-size:45px;

        color:green;

        border:2px solid blue

      }

      p{

        color:red;

        font-family:Arial;

      }

      #cars{

        margin-top:10px;

        margin-left: 60px;

      }

      #cars a{

        text-decoration: none;

        display: block;

        padding: 30px;

        font-size: 20px;

        color:black;

      }

    </style>

  </head>

  <body bgcolor="grey">

    <h1 align="center"><b>SHIFTGEAR</b></h1>

    <div id="cars">
```

```

        <br><br>
        <a href="#">Home</a>
        <a href="#">New cars</a>
        <a href="#">Used cars</a>
        <a href="#">Sell cars</a>
        <a href="#">Car loan</a>
    </div>
</body>
</html>

```

Second.html

```

<html>
    <head>
        <title>second</title>
        <style>
            p{
                font-size:30px;
            }
        </style>
    </head>
    <body bgcolor="cyan">
        <P style="color:brown;font-family:Arial;">Shift gear is one of the india's <br>leading
        source of new car pricing and other car related information.</p>
    </body>

                font-family:georgian;

            }
```

Program No.4

HTML files using different styles

Aim: Create an HTML file by applying the different styles using inline, external, internal style sheets.

Algorithm :-

Step 1. Open a text editor or HTML editor.

Step 2. Start with an HTML5 doctype declaration: `<!DOCTYPE html>`.

Step 3. Add the opening and closing html tags.

Step 4. Add the head section within the html tags.

Step 5. Within the head section, add a title tag to give the page a title.

Step 6. Add a link tag to include an external style sheet in the head section.

Use the rel attribute with a value of stylesheet, the type attribute with a value of text/css, and the href attribute with the file path or URL of the external style sheet. For example: `<link rel="stylesheet" type="text/css" href="style.css">`.

Step 7. Add an style tag to include internal style sheet in the head section.

Use the type attribute with a value of text/css. Within the style tag, write CSS rules to apply styles to HTML elements on the page.

```
</style>

<link rel="stylesheet" href="style1.css">

</head>

<body>

    <h2>GitHub</h2>

    <p id="p1">GitHub is a developer platform that allows developers to
    create,store,manage and share their code.<br></p>

    <h2>W3schools</h2>

    <p class="c1">W3schools is a freemium educational website for learning coding
    online.<br>Initially released in 1998,it derives its name from the world wild website
    but is not affiliated with the W3 consortium.</p>

    <h3 id="H3">Infosys</h3>

    <p id="p2">Infosys Limited is an indian multinational technology <br>brcompany
    that offers bussiness consulting,information technology,and outsourcing
    services.<br></p>

</body>

</html>
```

```

Program No.5

Registration form using HTML

Aim: To create a registration form using HTML.

Algorithm:-

- Step 1. Open a text editor or HTML editor.
- Step 2. Add the body section within the html tags.
- Step 3. Use the form tag to define the registration form.
- Step 4 Use the action attribute within the form tag to specify the URL of the page that will handle the form data.
- Step 5. Use the method attribute within the form tag to specify the HTTP method to use for submitting the form data (e.g. "get" or "post").
- Step 6. Use the input tag to define each input field within the form.
- Step 7. Use the type attribute within the input tag to specify the type of input field (e.g. "text", "password", "email", "checkbox", etc.).
- Step 8. Use the name attribute within the input tag to specify a name for each input field.
- Step 9. Use the placeholder attribute within the input tag to specify a placeholder text for each input field.
- Step 10. Use the required attribute within the input tag to specify whether or not each input field is required.
- Step 11. Use the label tag to create a label for each input field.
- Step 12. Use the for attribute within the label tag to associate the label with its corresponding input field using the id attribute.
- Step 13. Use the button tag to create a submit button for the form.
- Step 14. Use the type attribute within the button tag to specify the type of button (e.g. "submit").
- Step 15. Add any additional HTML elements or styling as desired.

```

Program No.6

Predefined functions in a string and math object in javascript

Aim:- To create a HTML page to explain the use of various predefined functions in a string and math object in javascript.

Algorithm:-

Step 1. Create a new HTML file. Program executed and output obtained successfully.

Step 2. Add a title to the page, such as "JavaScript String and Math Functions".

Step 3. Create a new section in the page to explain the String functions.

Add a heading to this section.

Step 4. List the various String functions that you want to explain. For example,

you could include functions such as `charAt()`, `concat()`, `indexOf()`, and `replace()`

Step 5. For each function, provide a brief description of what it does and how it is used.

You could also include an example of how to use the function in JavaScript code.

Step 6. Create a new section in the page to explain the Math functions.

Add a heading to this section.

Step 7. List the various Math functions that you want to explain. For example,

you could include functions such as `abs()`, `sqrt()`, `ceil()`, and `floor()`.

Step 8. For each function, provide a brief description of what it does and how it is used.

You could also include an example of how to use the function in JavaScript code.

Step 9. Save and preview the HTML file in a web browser to ensure that everything

is working correctly.

Step 10. Optionally, you can add styling and formatting to the page using

CSS to make it more visually appealing.

```
}
```

```
table {  
    width: 100%;  
}
```

```
th {  
    text-align: left;  
}
```

```
.selector {

Output:-

STRING FUNCTIONS

Enter a text

hello goodmorning

Search a text

good

Slice start

h

Slice end

g

Replace the word

hello

Replace with

hai

Generate

- Length of string is : 17
- First index of good is 6
- Last index of good is 6
- Index with search starting position 5 of good is 6

MATH FUNCTIONS

Enter a Number

4.6

Power term

2

Generate

- Value of PI : 3.141592653589793
- Round of 4.6 is : 5
- 4.6 raise to 2 is : 21.159999999999997
- Square root of 4.6 is : 2.1447610589527217
- Absolute value of 4.6 is : 4.6
- Ceil value of 4.6 is : 5
- Floor value of 4.6 is : 4
- Sin value of 4.6 is : 0.0801989243288589

Program No.7

Form validation

Aim :- Create a HTML registration form and to validate the form using JavaScript code.

Algorithm :-

Step 1: Start to create an html form with the required fields.

Step 2: Design the html form using CSS.

Step 3: With the help of JavaScript validate the filled data in the form.

Step 4: if name is not satisfies the condition (/[0-9!@#\$%^&*]/), pop up the error message

Step 5: if mail id is not satisfies the

condition (/^(?=\d)(?=[az])(?=[@])(?=[gmail])(?=[.])(?=[com])/), pop up the error message

Step 6: if password is not satisfies the

condition (/^(?=\d)(?!@#\$%^&*)(?=[a-z])(?=[A-Z]).{8,}\$/;), pop up the error message

Step 7: if mobile number is >10, pop up the error message

Step 8: If the entered data is invalid then an error message is raised when we click on the submit button.

Step 8: If the data is valid then accept the entered data to the database.

Step 9: Stop.

```

Program No.8

Background change using javascript

Aim: To create a HTML page to change the background color for every click of a button using JavaScript Event Handling.

Algorithm:

Step 1 : create a html file.

Step 2 : Inside head tag, declare style tag.

Step 2.1 : create "container" named class. Set width and height100%, text align property: center and displaystyle as grid.

Step 2.2 : create another style class using button id "#btn". Set margin property : auto , padding : 1rem , border-thickness : 3pxand color : black. Step 2.3: Close style tag.

Step 3 : Inside body tag open a div tag , and assign classname ".container" as the newly created div's class.

Step 4: Inside the div create a self closing input tag set id= "btn", type= "button",value = "Change Backgorund".

Step 5 : Close div tag, open a script tag.

Step 5.1 : Inside script tag create a addEventListener for the button to invoke the Function "colorChange()", when the button is clicked.

Step 5.2 : Declare the function colorChange().

Step 5.3 : Declare a variable name "color" to store the hexadecimal color code generated using math.random(), math.floor() and toString().

Step 5.4: Set the body background style using color variable value.

Step 6 : Close the script tag.

Step 7: Stop.

Program No.10

Online Examination

Aim :- Create a HTML page to show online exam using Javascript

Algorithm:-

Step 1. Open a text editor or HTML editor.

Step 2. Add the opening and closing html tags.

Step 3. Add the head section within the html tags.

Step 4. Within the head section ,add a title tag to give the page title.

Step 5. Use the type attribute with a value of style,the type attribute with a value of text/css.

Step 6. Add a style tag to include the internal style sheet in the head section.

Step 7. Inside script tag include the questions and the choices to be given.

Step 8. Inside the script tag create a function renderQuestion() to check and print the correct no of questions answered.

Step 9. Assigns the position to the choices using [pos][i].

Step 10. On Clicking the button the check answer() will be implied.

Step 11. Create the function check answer() to store the value to choice variable till the maximum length and correct and position variables will be incremented.

Step 12. Create an addEventListener and assign the parameters.

Step 13. Close the script tag.

Step 14. Open the body tag and set id="test_status" and id="test" which is to be performed in the function renderQuestion().

Step 15. Close the body tag and html tag.

```

["Who created database?", "Edgar Frank Codd", "Paul Niar", "Given Bariacto", "A"],

        ["Who created c++ language?", "Kirk Eriman", "Bjarne Stroustrup", "Jomhel Dulla",

Program No.11

Form validation using PHP

Aim:-To validate the web form using PHP.

Algorithm:-

Step 1.1: Design an HTML form with the following input fields:

Name

Email

Mobile Number

Username

Password

Step 2.1: Establish a Database Connection.

Step 2.2: Use the following code to connect the form to the database:

```
$con = mysqli_connect("localhost", "root", "", "sampledb");
```

Step 2.3: Ensure the connection is successful. If not, handle the error.

Step 3.1: Validate User Input

Step 3.2: Name Validation

a. Use the regular expression `preg_match("/^[a-zA-Z]*$/", $name)` to ensure the name contains only letters and spaces.

b. If the validation fails, display a popup message: "Enter a valid name!"

Step 3.3: Email Validation:

a. Use `filter_var($email, FILTER_VALIDATE_EMAIL)` to validate the email format.

b. If the validation fails, display a popup message: "Enter a valid email address!"

Step 3.4: Mobile Number Validation:

a. Use the regular expression `preg_match('/^[0-9]{10}+$/ ', $_POST['mob'])`

to ensure the mobile number contains exactly 10 digits.

b. If the validation fails, display a popup message: "Enter a valid mobile number!"

c. If the validation fails, display a popup message: "Enter a valid mobile number!"

<h2>FORM VALIDATION</h2>

```
<form name="form" action="#" method="POST">
```

```
<table>
```

```
<tr>
```

```
<th>Name</th>
```

```
<td><input type="text" name="fname"> </td>
```

```
</tr>
```

```
<tr>
```

```
<th>Email</th>
```

```
<td><input type="email" name="email"> </td>
```

```
</tr>
```

```
<tr>
```

```
<th>Mob NO </th>
```

```
<td><input type="tel" name="mob"> </td>
```

```
</tr>
```

```
<tr>
```

```
<th>Username </th>
```

```
<td><input type="text" name="user"> </td>
```

```
</tr>
```

```
<tr>
```

```
<th>Password </th>
```

```
<td><input type="password" name="password"> </td>
```

```
</tr>
```

```
<tr class="center">
```

```
<th colspan="2"><input type="submit" value="submit" name="submit"></th>
```

```
</tr>
```

```
</table>
```

```
</form>
```

```
<?php
```

```
$con = Mysql_Connect("localhost","root","","sampledb");
```

```
if(isset($_POST['submit']))
```

step 3.5: Password Validation:

a. Check that the password meets the following criteria:

b. Contains at least one uppercase letter: `preg_match("#[A-Z]+#", $password)`

c. Contains at least one lowercase letter: `preg_match("#[a-z]+#", $password)`

If the validation fails, display a popup message: "Enter a valid password with at least one uppercase and one lowercase letter!"

Step 4.1: Store Data in the Database

Step 4.2: If all validations pass, prepare an SQL query to insert the data into the database:

```
$query = "INSERT INTO register(name, mail, mobile, password, user)
VALUES('$name', '$email', '$mobile', '$password', '$user');"
```

Step 4.3: Execute the query using `mysqli_query($con, $query)`.

Step 5.1: Handle Successful Submission

Step 5.2: If the data is inserted successfully:

Display a popup message: "Successfully submitted!"

Step 6.1: Handle Errors

Step 6.2: If the query fails or an error occurs during validation or submission:

Display an error message describing the issue.

Step 7: apply the css styles to attract the web form.

Step 8: End

```

{
    $name = $_POST['fname'];
    $email = $_POST['email'];
    $mobile = $_POST['mob'];
    $user = $_POST['user'];
    $password = $_POST['password'];
    if($_POST['fname'] == "")
    {
        echo "<script>alert('Enter First Name !!')</script>";
    }
    else if(!preg_match("/^[a-zA-Z ]*$/", $name))
    {
        echo "<script>alert('Enter Your Name !!')</script>";
    }
    else if($_POST['email'] == "")
    {
        echo "<script>alert('Enter Email !!')</script>";
    }
    else if(!preg_match('/^[0-9]{10}+$/', $_POST['mob']))
    {
        echo "<script>alert('Enter Valid Mobile Number !!')</script>";
    }
    else if($_POST['user'] == "")
    {
        echo "<script>alert('Enter User Name !!')</script>";
    }
    else if($_POST['password'] == "")
    {
        echo "<script>alert('Enter Password !!')</script>";
    }
}

```

```

else if (strlen($_POST["password"]) < 8)
{
    echo "<script>alert('Your Password Must Contain At Least 8 Characters!')</script>";
}
else if(!preg_match("#[0-9]+#", $password))
{
    echo "<script>alert('Your Password Must Contain At Least 1 Number!')</script>";
}
else if(!preg_match("#[A-Z]+#", $password))
{
    echo "<script>alert('Your Password Must Contain At Least 1 Capital Letter!')</script>";
}
else if(!preg_match("#[a-z]+#", $password))
{
    echo "<script>alert('Your Password Must Contain At Least 1 LowercaseLetter!')</script>";
}
else
{
    $query = "insert into
register(name,mail,mobile,password,user)values('$name','$email','$mobile','$password','$user')";
    if(mysqli_query($con,$query))
    {
        echo "<script>alert('Successfully submitted')</script>";
    }
    else
    {
        echo "error".mysqli_error($con);
    }
}
?>

Program No.12

Display table contents

Aim:PHP program to retrieve the database contents and display it into a table form.

Algorithm:-

Step 1.1: Create the HTML Structure.

Step 1.2:Design a webpage using HTML with the following

A table with the following column headers:

ID

Name

Author

Edition

Publisher

Step 2.1: Establish a Database Connection

Step 2.2:Use the following details to connect to the database:

```
$con = mysqli_connect("localhost", "root", "", "sampledb")
```

Step 2.3:Ensure the connection is successful. If not, handle the error.

Step 3.1: Write the SQL Query

Step 3.2:Prepare an SQL query to fetch all book records from the books table:

```
SELECT * FROM books.
```

Step 4.1: Display Book Details

Step 4.2:For each record, dynamically create a new row in the HTML table and populate the columns with data:

Step 5.1: Complete the Table

Step 5.2:End the table structure after looping through all records.

Step 6.1: End

```

echo"<td>$row[2]</td>";

echo"<td>$row[3]</td>";

echo"<td>$row[4]</td>";

echo"</tr>";

}

?>

</table>

</body>

</html>

```

Output:-

ID	NAME	AUTHOR	EDITION	PUBLISHER
1	Half Girlfriend	Chetan Bhagat	2nd	Srk publisher
2	400 Days	Chetan Bhagat	3rd	Srk publisher
3	A Song Of Ice And Fi	George R R Martin	5th	Bantam Books
4	Harry Potter	J.K.Rowling	4th	Bloomsbury

Result:- Program executed and output obtained successfully

Program:-

home.php

```
<?php
    session_start();
    if(isset($_SESSION['username']))
    {
        echo "hai"." ".$_SESSION['username'];
    }
    else

Program No.13

Login form

Aim:To create the Login form using PHP and session variable

Algorithm:-

Step 1.1: Start the Session

Step 1.2:Start the session in PHP using session_start().

Step 2.1: Design the Login Form

Step 2.2.Create an HTML form for user login

User Name

Password

Step 2.3:Use the POST method to submit the form data

Step 3.1: Establish Database Connection

Step 3.2:Include the database connection file using:

require "connection.php".

Step 4.1: Validate User Credentials

Step 4.2:Write an SQL query to fetch user details:

\$query=SELECT * FROM logintbl WHERE name='\$user' AND password='\$passcode'.

Step 4.3:Handle query execution errors:

If \$login_result is false, display an error message: "login error".

Step 5.1: Check Login Success

Step 5.2:Redirect the user to the home.php form.

Step 5.3:If no rows are found

Display an alert message: "there is no user".

Step 7: End

```

<body>
  <center>
    <form action="#" method="POST">
      <table>
        <tbody>
          <tr>
            <td>User Name: <td>
              <td><input type="text" name="uname"></td>
            </tr>
          <tr>
            <td>Password : <td>
              <td><input type="password" name="passcode"></td>
            </tr>
          <tr>
            <td colspan="2"><input type="submit" name="login" value="login" id="btn"></td>
